The Full Range of IoT Products

Intelligent IoT Gateway

Matrix Arm-based IoT Gateway is a Linux-ready industrial computing platform designed for data concentration and device gateway. Built rugged, its extra low-power RISC architecture realizes fanless computing. For real-time and small footprint applications such as protocol conversion and real-time control, the compact and easy-to-use FreeRTOS is the Artila's choice of software operation platform. Artila Intelligent IoT Gateway allows customers to integrate in their systems efficiently and painlessly.

IoT Device Platform

Artila M-series Arm+Linux-ready System on Module (SoM) is an application-ready platform for designers to reduce cost and time in hardware and software design. The M-series SoM, including Arm SoC, memory and flash, and pre-installed Linux OS, are in a compact size module with pin header or SO-DIMM form factor. The pre-loaded file system includes busybox utility collection, web server and USB device drivers. Artila M-series accelerate the adoption of IoT and facilitate innovation in the digital enterprise.

Programmable Automation Controller

PAC series is a Linux-based, C/C++ programmable automation controller. Network-enabled and web-ready PAC features rich analog and digital I/O for real-world I/O control. Based on M-series SoM, PAC is a true Linux computing platform with file system support. With failure prevention and the design of redundant start-up, Artila PAC series are ideal for many mission-critical applications.

Modbus Gateway

The Aport series come with Arm cortex M series controller plus FreeRTOS and programmer friendly APIs make your life easy. For budget limitation project, the low power Arm CORTEX-M plus the high efficient FreeRTOS make Aport Series an ideal light weight computing platform for device networking and remote monitoring.

Remote I/O

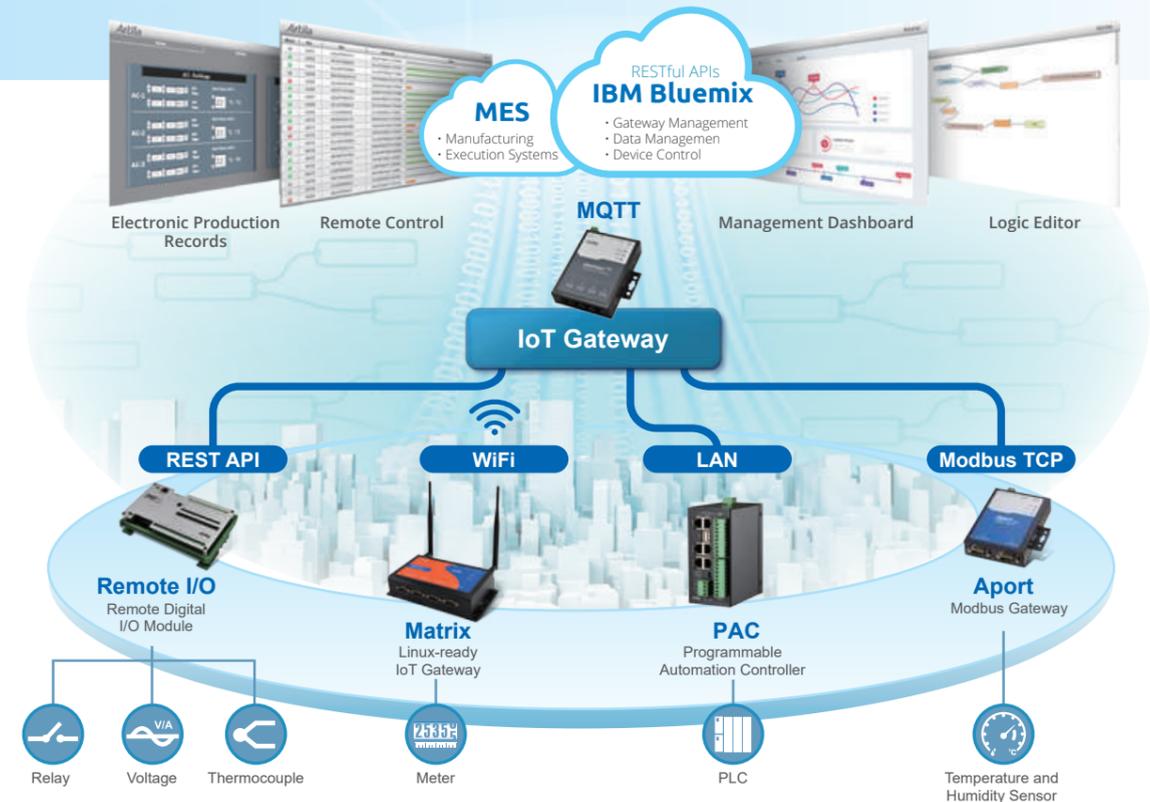

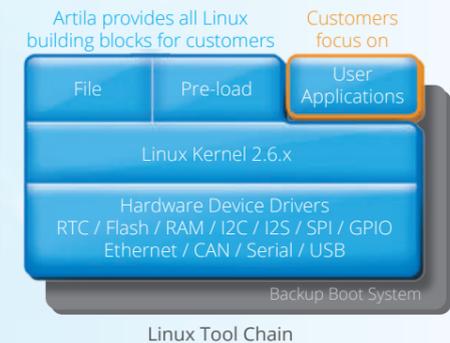

The RIO family, a web-ready, analog and digital I/O product lines, allows users to access and monitor the real-world data by using web interface or Modbus TCP / RTU protocols. Windows and Linux API library are also included in the RIO family. Thus, users can access the RIO products easily to cope with the fast-pace and ever-changing trend of the industrial computing industry.

Remote Monitoring and Management System Allows the Control of Solar Power Plants to Exceed Efficiency

Developers of industrial applications expect reinforced isolation products to provide fail-safe protection from secondary lightning strikes, especially in applications where equipment is installed outdoors and where exposed cables or wires are vulnerable to lightning.

The Matrix-704, a robust industrial gateway was eventually selected as the data concentrator for the aforementioned solar power monitoring system capable of gathering and analyzing data from sensors and meters deployed at the remote site. The Matrix-704 is responsible for the electricity monitoring system. Since Matrix-704 embedded industrial IoT Gateway with Linux-ready Cortex-A5, system designers can have the hardware platform featuring high performance, high stability and rich resources. Multiple RS-485 serial ports provide ample interfaces to facilitate system integration with peripherals. lights and volume control for telephone conferences.

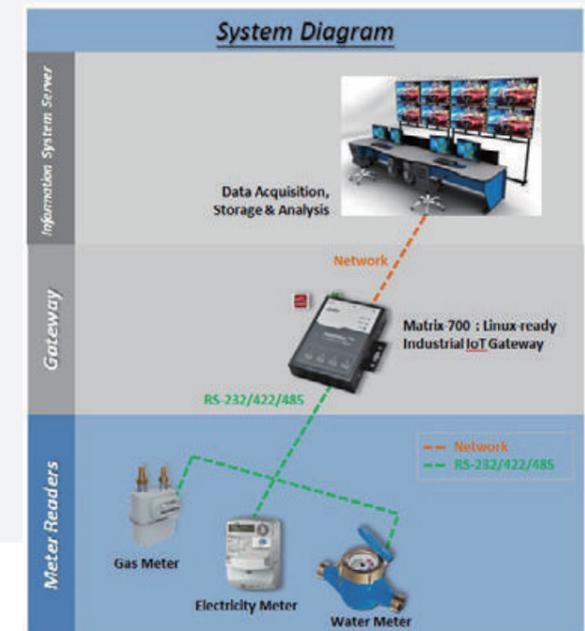

Environment and Facility Monitoring System

Automatic Meter Reading Application with Real-time Monitoring and Remote Management

As we all know that smart meter is a short-range communication device. For demanding communication range, the company wants to select an embedded Linux-based computer that provides adequate computing performance and connection interfaces as a data concentrator control core.

The Matrix-700 is based on the arm9 processor and Linux kernel. The system developer of this project is familiar with such development environment, so its designers can easily and quickly complete the product development. The high-speed arm processor and large memory also provide sufficient computing performance to execute the heavy tasks of the data concentrator.

Supporting multiple interface ports allows designers to develop the required functions according to the actual application needs such as: connecting a switch or router with an Ethernet port, connecting a smart meter or sensor with a high-speed serial port, using USB 2.0 port to set up the wireless network, and utilizing the micro-SD slot to insert the external memory card for storage capacity expansion.

Environmental Monitoring & Facility Management

Ensures Stable Operation of Electronic Payment Terminal at Self-service Gas Station

A System Integrator of electronic payment terminal was implementing self-service gas stations, in order to meet the economic benefits, the oil pump island usually needs to install multiple fuel dispensers. In the case where the remaining space on the island is quite narrow, the System Integrator has to specifically design a pillar-type and compact-size electronic payment terminal for this project. Plus, gas station is part of the harsh environments and outdoor applications, so the company hoped to choose a compact and durable computing platform to execute its system developed for the self-service gas station.

The M-A5D35 is an embedded computing platform which features ultra-small appearance and wide temperature range, and is able to meet the needs of System Integrator. The designers can easily integrate this palm-sized SoM into the electronic payment terminal. Rich IOs enable the designers to establish intranet and internet for the system at the same time, so that preventing enterprise data loss or website hacking by setting the access authority.

Intelligent Transportation System

Parking Lot Monitoring System

The electric bus charging company has also developed a charging station management system to facilitate operators to manage charging stations. During the development process, the company found that the configuration of only one serial server to manage hundreds of parking spaces and handling hundreds of meters of data would place the system at high risk of instability. Therefore, it decided to implement the appropriate industrial-grade embedded IoT Gateway for parking management system and electricity monitoring system separately.

Artila's Matrix IoT Gateway could install easily in the monitoring system for its serial ports. With the low power consumption, fanless design and compact internal structure, Matrix series are small-sized IoT Gateway. They are not only convenient for installation and maintenance, but also are not easy to inhale the dust particles so that the system can run more stable.

Building Automation

Intelligent Conference Room Situational Control Solution

In such application structure, by placing the M-502 into the company's power distribution board and with the multi-functional GPIO interface of M-502, an intelligent control can be realized after conversation to achieve the function of auto-turning off meeting room facilities to ultimately realize the purpose of energy management such as the turning on/off of projectors, lighting control, electric curtains, intelligent air-conditioning, video systems, etc.

Also, the one-to-many instant monitoring and control function can be integrated for a relational situational control for multiple objects at the same time, for example, during a meeting, the instant data monitoring can be done for the speaker's movement, interior temperature and humidity, light, sound, etc., and the instant control can be done for projector screen up/down, air-conditioning, lights and volume control for telephone conferences.

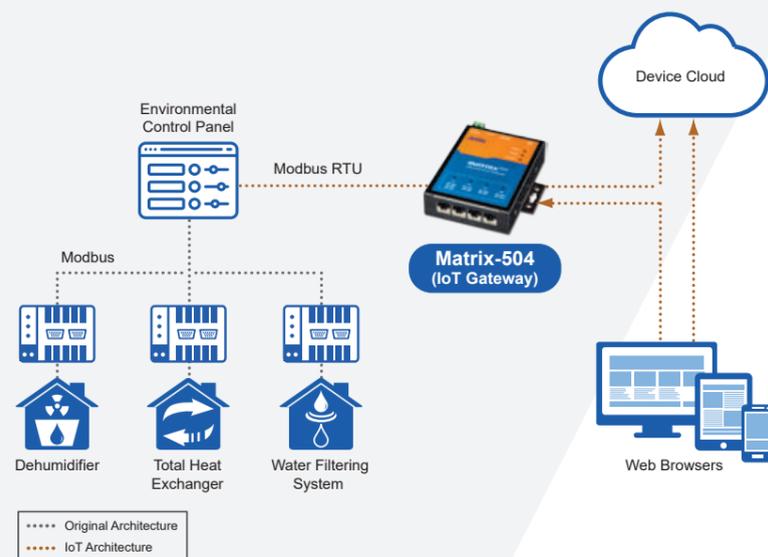

Environment and Facility Monitoring System

Intelligent Household Environment Control Solution

Most of traditional household appliances cannot connect to internet directly, while it takes a long time for the change and evolution from design aspect. However, as the development trend of IoT is rapidly spreading into the household market, a stable and reliable gateway is expected to be developed for reading traditional control signals at one end and connecting to cloud platforms at the other end.

In such application structure, Matrix-504 enables developers to connect traditional household appliances to a cloud server in the simplest and fastest way, by which to immediately upgrade them into intelligent appliances that can be controlled and monitored by remote units for the intelligent adjustment and control function of household environmental conditions, and to effectively attain the purpose of energy saving.
